When to use it

Count rows per category: how many VMs per cluster. TopN keeps the biggest categories. ShowPercent adds the share. ClickFilters turns a bar into a filter on the table below.

VMs per cluster

Top 3 roles

Bars › Measure a value

When to use it

Give -ValueField and -Aggregate (sum, avg, min or max) to chart a number, not a row count: average CPU per cluster, total memory per role. -Rag colours each bar by its value.

Average CPU by cluster

Total memory by role (GB)

Bars › Stacked and coloured

When to use it

SeriesField with -Stacked splits each bar by a second column. -KeyClass colours a bar by its name (Critical red, Low green), which a single accent colour cannot do.

VMs per role, by power state

VMs by severity

Pies › Pie and donut

When to use it

> Use a pie for a share of a whole with few slices. From a table (left) it counts a column and a click on a slice filters the table; with explicit slices (right) you give the numbers. Donut shows the total in the middle.

Virtual machines (click a slice to filter)

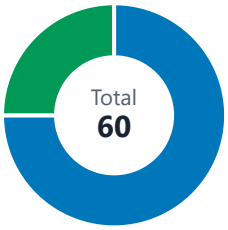

VM	CLUSTER	POWER	CPU %
vm-001	dev	On	69
vm-002	test	On	46

vm-057	prod	On	68
vm-058	dev	On	14
vm-059	test	Off	15
vm-060	prod	On	45

Power state (from the table below)

On	**45** (75%)
Off	**15** (25%)

Account states (explicit numbers)

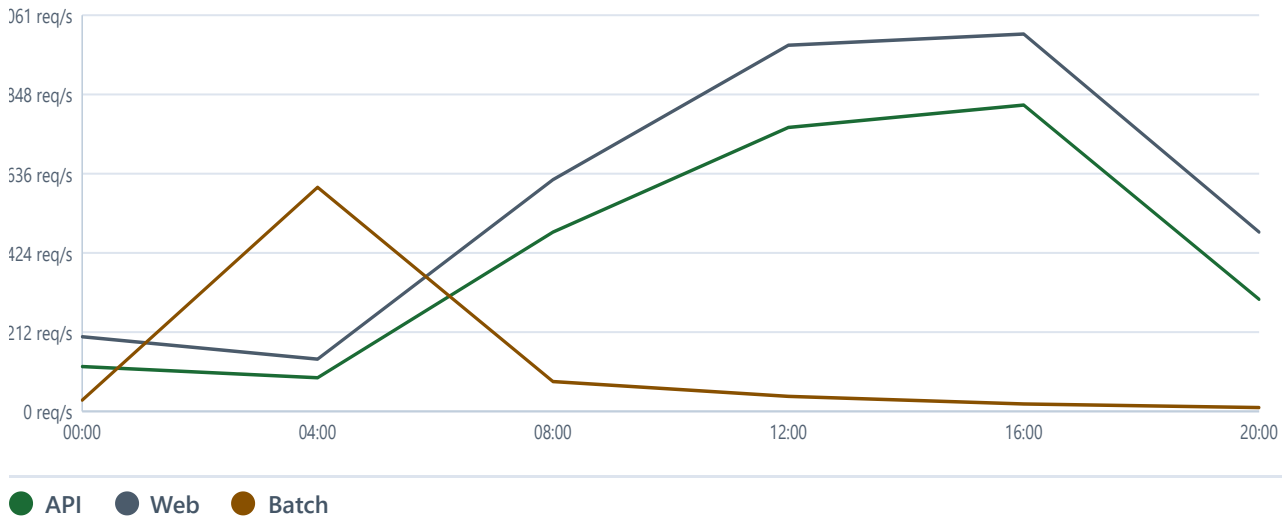

Enabled	**15420** (93%)
Disabled	**820** (5%)
Locked	**42** (0%)
Stale	**214** (1%)

Lines › Trends

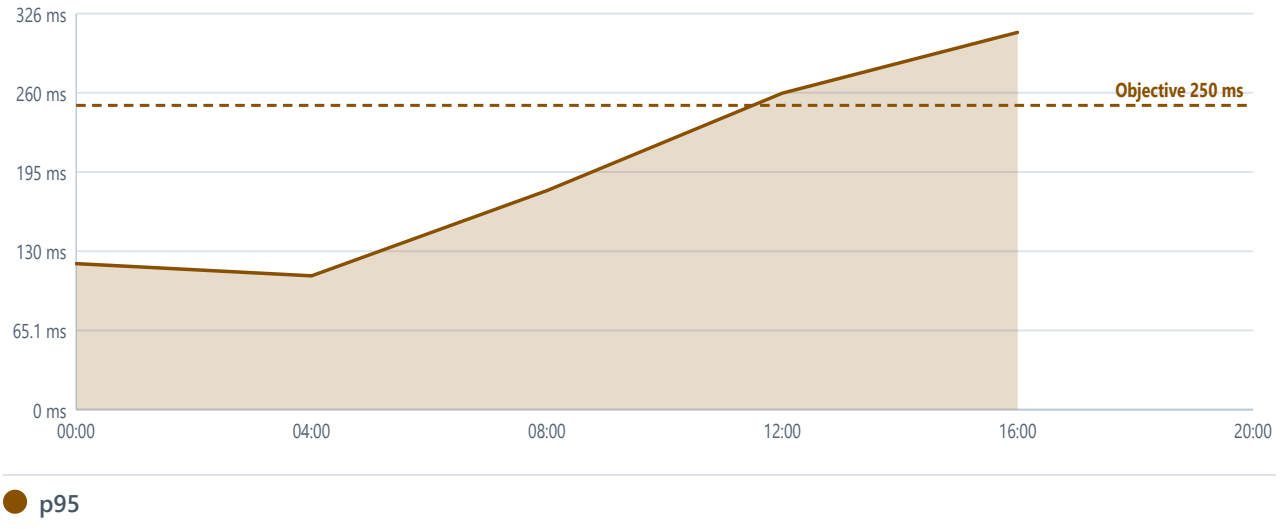

When to use it

Several series on one axis; -Filled draws areas (keep it to one to three series); -TargetLine draws a threshold. A $null in a series leaves a gap rather than a zero.

Requests per second

Latency against the objective

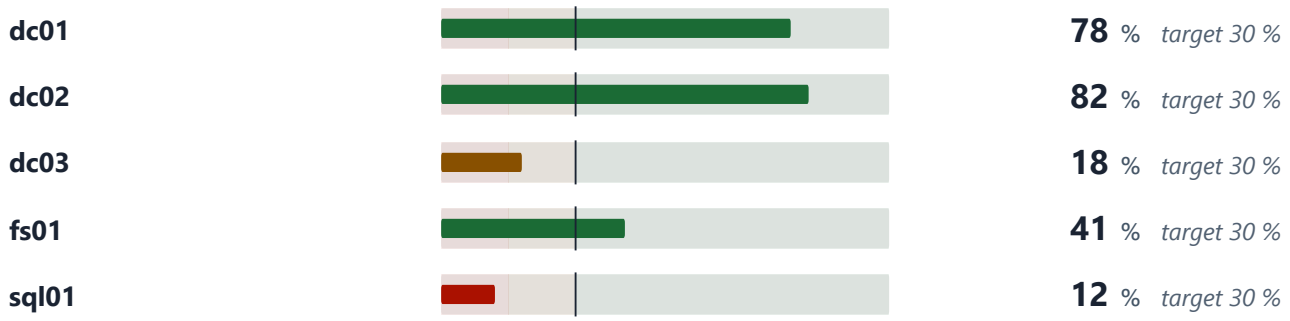

Targets › Bullets

When to use it

A bullet chart answers "how far from the target, and is that good?": the bar is the value, the tick is the target, the bands are green, amber and red. Reverse the bands when higher is better (free space) or lower is better (latency).

Free disk space against the 30% target

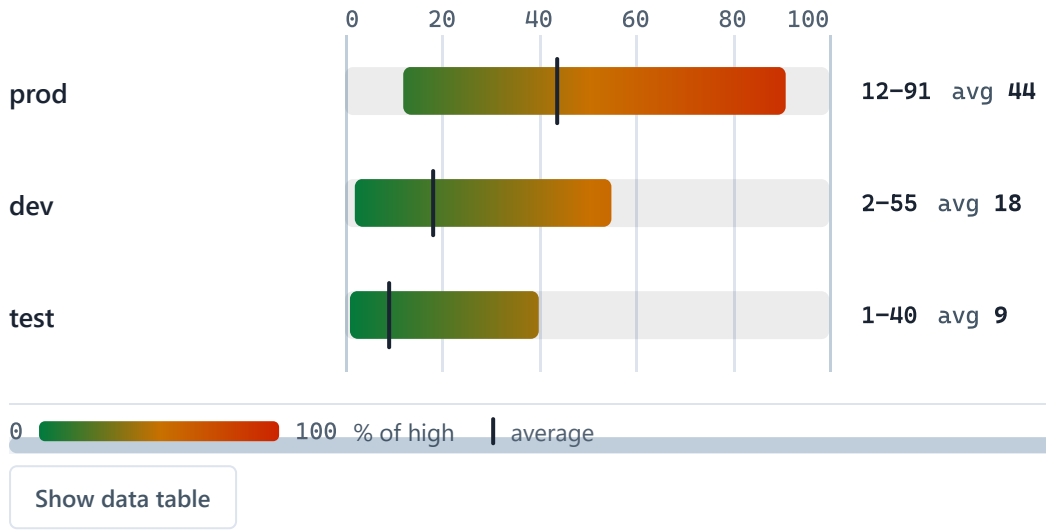

Targets › Ranges

When to use it

A range bar shows min, average and max of each entity on one shared axis, each scaled against its own capacity (High). It reads a table and recomputes live when the table is filtered, or takes explicit items as here.

CPU range per cluster

Show data table
