Cells › Types and formats

In this view

Column Format controls how a value is shown (the data stays raw, so sorting and export stay correct): number, currency, bytes, percent, datetime, duration. Align right for numbers. PinFirst keeps the first column in view while you scroll sideways.

Cells › Colour rules

In this view

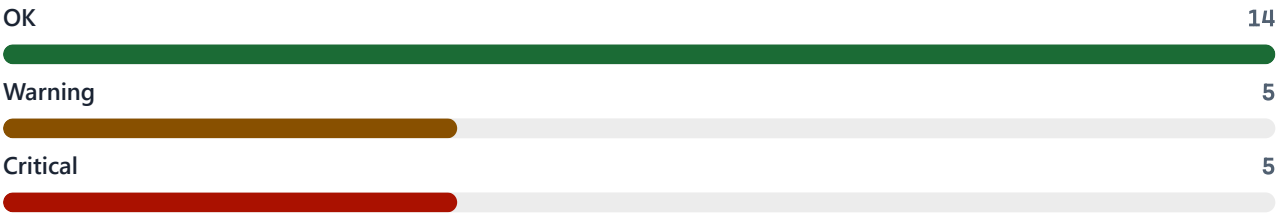

Rag colours a number by bands; CellType progressbar draws it; badge colours a word with Thresholds; RowHighlight on a column paints the whole row.

Cells › Lists and trends

In this view

chips shows a list as tags; path draws a chain (who reaches what); sparkline draws a small trend and sorts by its last, max, min, avg or sum; link turns a URL column into a link (http, https, mailto and tel only); UrlTemplate builds the URL from the row (Portal column). New-DhDashboard -LinkState keeps each table's sort, page and page size in the address, so a copied link opens the same view.

Interaction › Detail panel

In this view

Click (or press Enter on) a row: every property of the row opens in a side panel, including ones that are not columns. Escape or a click outside closes it. DetailFields chooses and labels the properties.

Interaction › Linked tables

In this view

Set-DhTableLink joins two tables. Both sit on the SAME path so they stack on one view; click a department and the staff table filters to it. Click it again to clear.

Departments (click a row)

DEPARTMENT	HEAD	PEOPLE
Sales	Sales lead	10
Finance	Finance lead	30
Engineering	Engineering lead	20

Staff in the selected department

Interaction › Selection and totals

In this view

MultiSelect adds checkboxes (export and linked tables honour the selection). Aggregate puts a total, average or count in the footer. Shift-click column headers to sort by several columns.

  - Headquarters 3
    - Headquarters (old) **empty** 1
  - Branches 3

Layout › Column widths

In this view

By default every column is as wide as its widest text (header included), up to -ColumnMaxWidth (800 px). A column Width wins; MinWidth sets a floor; the reader can drag an edge, or double-click it to fit that column. The second table uses -ColumnFit Fixed (cells cut at 340 px, with a tooltip).

Automatic widths

DISTINGUISHED NAME	DESCRIPTION	STATE	DECLARED 90 PX

Layout › Column picker

In this view

The Columns button lists every column. A column with Hidden = $true starts unticked (here Ip, Cores and Owner); the button then says how many are hidden. With -RememberColumns the choice is kept for this reader in this browser and restored next time, even after the report is regenerated; Default columns in the picker puts the author's choice back and forgets the saved one. With -RememberViews the Views button saves the current columns, sort, page size and filter under a name, to apply again later. Nothing is stored unless these switches are on.

Servers (try the Columns button)

Layout › Since the last run

In this view

-Baseline takes last run's rows and -KeyField names the property that identifies a row. New and Changed rows carry a tag and a coloured edge, a changed cell shows its old value on hover, the line under the toolbar counts them, the chips filter the table, and the rows that disappeared wait in a collapsed group under the table. Exports gain a Change column.
